

AMENDMENTS TO THE SPECIFICATION (INCLUDING ABSTRACT)

Without prejudice, please amend the disclosure as below:

Please cancel the paragraph on page 8 beginning at line 21 and replace it with the following paragraph:

Fig. 6A shows an electrode 16 comprising the transparent polymeric film 10 and a wire mesh 6 of the wires 5' and 5" of the first and second pluralities. Only the wires 5" being more closely located to the polymeric film 10 are immersed in the adhesive 11 (see also Figs. 6B and 6C). The upper or outer wires 5' coming intooperable to contact with the surface or surfaces of the wafer 3 are not, at least not completely, immersed in the adhesive 11 (during the production of this type of an electrode 16 the roll 7 carries a wire mesh 6, and frame 9 is not used (Fig. 4)). Already at this point, the wires 5', 5" may be soldered together. However, usually this is done at the time of assembly of the electrode 16 and the wafer 3.
